For seven years, CASA has been engaged in the unprecedented undertaking of surveying attitudes of teens and those who most influence them--parents, teachers, school principals. Other surveys seek to measure the extent of substance abuse in the population; our survey probes substance-abuse risk. We seek to identify factors that increase or diminish the likelihood that teens will use tobacco, alcohol or illegal drugs in an effort to develop the most effective means of helping teens avoid substance use and abuse.

CASA’s surveys have consistently found that the family is fundamental to keeping children away from tobacco, alcohol and illegal drugs. The 2002 CASA National Survey of American Attitudes on Substance Abuse VII: Teens, Parents and Siblings keeps the focus on family, and this year seeks to assess the impact of siblings on the likelihood of teen substance abuse. This is an enormously complex task and, as with any such cutting edge analysis, we see this as a work in progress. We believe this survey provides important insights that can help parents teach their children to resist the lure of cigarettes, alcohol and drugs.

This year we surveyed 1,000 teens ages 12 to 17 (470 boys, 530 girls) and 541 parents, 317 of whom were parents of the teens we interviewed. The most striking conclusions are these:

- For the first time, a majority of teens (63 percent) tell us they attend drug-free schools.

- Siblings have a major impact on substance-abuse risk: teens who say their older brothers or sisters would be “very angry” to find out they were using marijuana are at substantially lower risk of substance abuse than teens whose older siblings would not be very angry.
• Among teens who admit to smoking, drinking or having tried marijuana, by 15 years of age: 95 percent have smoked their first cigarette, 93 percent have tried their first drink and 86 percent have tried their first joint.

• For the seventh survey in a row, teens continue to say drugs are their biggest concern.

• For the first time, a higher percentage of teens surveyed finds marijuana easier to buy than both cigarettes and beer.

**Drug-Free Schools**

For the first time in the history of this survey, a majority of teens say they attend drug-free schools. This increase was significant in both public schools and religious schools: 62 percent of 12- to 17-year olds in public school say their schools are drug free, compared to 42 percent in 2000, and 79 percent of those in religious school say so, compared to 65 percent in 2000. Teens who attend drug-free schools are at roughly half the risk of substance abuse of teens who attend schools where drugs are used, kept or sold.

Though this increase in the percentage of schools that are drug free represents a substantial improvement, much remains to be done:

• One in four students has personally witnessed the sale of illegal drugs on school grounds.

• Almost one in 10 teens (eight percent) believes a teacher at their school uses illegal drugs.

When it comes to detecting drugs in schools, parents and administrators should keep in mind that where there’s smoke, there’s fire. Smoking on school grounds and drugs in schools appear to go hand-in-hand: drugs are used, kept or sold at more than half (55 percent) of schools where students smoke on school grounds, but at less than a quarter (21 percent) of schools where students do not smoke on school grounds.

**Siblings: Protectors or Pushers**

This year we turned our attention to siblings and found that sibling behavior has a major influence--for good or ill--on a teen’s substance-abuse risk. An older sibling can be a protector whose conduct provides a support system that helps a younger sibling stay substance free. Or a sibling can be a pusher in the home by the example of his or her own drug use or by offering or encouraging a younger sibling to use drugs. The survey found:

• Sixty-seven percent of teens with an older sibling say their older brothers or sisters would be “very angry” to find out they were using marijuana. These teens are at substantially lower risk of substance abuse than teens who think their older siblings would not be very angry.

On the flip side, older siblings’ negative behavior increases their younger siblings’ risk of using tobacco, alcohol or illegal drugs.

• Almost half (48 percent) of teens with an older sibling think that an older brother or sister has tried illegal drugs. These teens are at one and a half times greater risk of substance abuse than the average teen.

• Twelve percent of teens with an older sibling report that an older brother or sister has encouraged them to use or offered them illegal drugs. A teen who lives with such a pusher in the home is almost twice as likely to smoke, drink or use illegal drugs as the average teen. A pusher in the home is equally likely to be an older sister or brother.

**The Early Teens: The Dangerous Years**

Most teens who use alcohol, cigarettes and marijuana do so by the time they are 15. Among teens who admit to smoking, drinking or having tried marijuana, the average age of first use is 12 ¼ for cigarettes, 12 ½ for alcohol and 13 ½ for marijuana.
Between ages 12 and 16:

- The likelihood that a teen will smoke, drink or use illegal drugs increases almost 500 percent.
- The percentage of teens who would not report a drug user at school increases almost 500 percent. The percentage of teens who would not report a drug seller at school increases more than 500 percent.
- The percentage of teens who have close friends that use marijuana increases 1,000 percent.

**Parental Paralysis**

Many parents seem to view teen drug use as a *fait accompli*. This year’s survey reveals widespread despair by parents of teenagers; many think parents have little power over their teens’ substance use and a disturbing number view drugs in schools as a fact of life that they--and administrators--are powerless to stop.

- More than a third (35 percent) of parents agree that parents have little influence over their teens’ decisions about using tobacco, alcohol or illegal drugs.
- Parents are more likely than teens to predict future drug use by their teens. Forty-three percent of parents--but just 16 percent of teens--say future drug use by the teen is “likely.”
- Teens whose parents think future drug use is “very likely” are three times likelier to smoke, drink or use illegal drugs than teens whose parents say future drug use is “not likely at all.”

Many parents feel paralyzed when faced with substance abuse in schools. Nine of 10 parents who say their teens attend schools where drugs are used, kept or sold think there are drugs in their teen’s school despite the best efforts of the administration.

Only half of parents whose teens attend schools where drugs are used, kept or sold would transfer their teen to a drug-free school if they could. Of those who would not transfer their teen, half believe there is no such thing as a drug-free school.

Parents who think they have no power over their teens are pulling the wool over their own eyes. Years of CASA research have repeatedly found that parents are the most important resource we have to prevent substance abuse in our teens. In the 2000 survey, half of teens (49 percent) who had not tried marijuana credited their parents with their decision. Expressing strong negative attitudes about marijuana to teens is important: teens who perceive marijuana as “not harmful” are at more than two and a half times greater substance-abuse risk than teens who think marijuana is “very harmful.”

The take-home message of this survey is this: if we want to prevent our teens from substance abuse, we need to bolster their will and skills to say no before age 12. The harsh reality is that for most teens, high school--and often middle school--is too late to begin.

Parents, teachers, school administrators and public policymakers must focus their attention on inoculating kids against all drugs in the early years before exposure occurs. Parents must play a key role in this drug education, but too many continue to underestimate the power they have over their teens’ decisions about substance use. We know from our past surveys that Parent Power is the most underutilized tool in helping teens steer clear of tobacco, alcohol and illegal drugs. Parents must harness this power and use it to make a difference in their teens’ lives. The dramatic increase in the number of drug-free schools demonstrates that change is possible. Yet too many parents remain silent while their teens continue to be put at risk by attending drug-infested schools. When parents raise their voices and refuse to tolerate drugs in their teens’ schools, the 63 percent will move closer to 100 percent.

I want to express CASA’s appreciation to Steve Wagner, President of QEV Analytics, and Elehie
Skoczylas, Vice President and Director of Research at QEV Analytics, for their insightful work in analyzing the data. We appreciate the counsel of our survey advisory group members: John Schulenberg, Ph.D., Senior Research Scientist at the University of Michigan’s Institute for Social Research and a Principal Investigator on the Monitoring the Future study; Peter Bearman, Ph.D., Professor of Sociology, Columbia University and Director of the Institute for Social and Economic Theory and Research, Columbia University and co-Principal Investigator of The National Longitudinal Study of Adolescent Health; Robert Shapiro, Ph.D., Chairman, Department of Political Science, Columbia University and Editor of “The Poll-Trends” Public Opinion Quarterly; Timothy Johnson, Ph.D., Director of the Survey Research Laboratory, University of Illinois, Chicago and Associate Professor of Administration; Richard R. Clayton, Ph.D., Scientific Director of the Center for Prevention Research at the University of Kentucky; Nicholas Zill, Ph.D., a Psychologist and Vice President and Director of the Child and Family Study Area, Westat, Inc., and J. David Hawkins, Ph.D., Director, Social Development Research Group, University of Washington.

Sarah Winkeller, Special Assistant to the President at CASA, and Jennie Leszkiewicz, Research Assistant to the President, were the project managers for this effort. They have done a superb job in helping analyze the data and were ably joined by Roger Vaughan, M.S., Dr.P.H., head of CASA’s Substance Abuse Data Analysis Center (SADACSM) and Consulting Editor for Statistics and Evaluation for the American Journal of Public Health. Ellen Ross, Director of Communications, and others at CASA lent their counsel. Jane Carlson and Sarah Kampel assisted with the charts.

All these individuals and institutions helped, but CASA and QEV Analytics are responsible for this report.
Chapter I
Key Findings

Overall Trends

In evaluating the responses of America’s teens, it is clear that our youth remain at substantial risk of substance abuse.

- For the seventh survey in a row, teens cite drugs, including alcohol and tobacco, as their biggest concern.

- Parents of teens also report that drugs and alcohol are their biggest concern about their teens.

- More teens are getting drunk on a monthly basis than in 2000 (15 percent vs. 11 percent).

- More teens report having tried marijuana than in 2000 (25 percent vs. 21 percent).

- Exposure to Ecstasy continues to grow: 33 percent of teens know a friend or classmate who has used this drug, up from 28 percent in the 2000 survey.

- For the first time, a higher percentage of teens surveyed finds marijuana easier to buy than both cigarettes and beer.

- 4.6 million 12- to 17-year olds (60 percent) are at moderate or high risk of substance abuse. This is little changed from the last survey.

siblings: Protectors or Pushers

Siblings have a major influence--for good or ill--on a teen’s substance-abuse risk.

- Sixty-seven percent of teens with an older sibling say their older brothers or sisters would be “very angry” to find out they were using marijuana. These teens are at
substantially lower risk of substance abuse than teens who think their older siblings would not be very angry.

- Almost half (48 percent) of teens with older siblings think an older brother or sister has tried illegal drugs. These teens are one and a half times likelier to smoke, drink or use drugs than the average teen.

- Twelve percent of teens with an older sibling report that an older brother or sister has encouraged them to use or offered them illegal drugs. A teen who lives with such a pusher in the home is almost twice as likely to smoke, drink or use illegal drugs as the average teen. A pusher in the home is equally likely to be an older sister or brother.

Drug-Free Schools

For the first time in the history of this survey, a majority of teens say they attend drug-free schools. This increase was significant in both public schools and religious schools: 62 percent of 12- to 17-year olds in public school say their schools are drug free, compared to 42 percent in 2000, and 79 percent of those in religious school say so, compared to 65 percent in 2000. Teens who attend drug-free schools are at roughly half the risk of substance abuse of teens who attend schools where drugs are used, kept or sold.

Despite the increase in the number of schools that are drug free, much remains to be done. One in four students has personally witnessed the sale of illegal drugs on their school grounds and almost one in 10 (eight percent) believes a teacher at their school uses illegal drugs.

Smoking on school grounds and drugs in schools appear to go hand-in-hand: drugs are used, kept or sold at more than half (55 percent) of schools where students smoke on school grounds, but at less than a quarter (21 percent) of schools where students do not smoke on school grounds.

Parental Paralysis

The CASA survey found that a disturbing number of parents believe they can do little to prevent their teens from abusing substances. More than a third (35 percent) agree that parents have little influence over their teens’ decisions about using tobacco, alcohol or illegal drugs.

Parents are more likely than teens to predict future drug use by their teens. Forty-three percent of parents—but just 16 percent of teens—say future illegal drug use by the teen is “likely.” Teens whose parents think future drug use is “very likely” are at more than three times higher risk of substance abuse than teens whose parents say future drug use is “not likely at all.”

Some parents also seem to believe they can do little to make their teens’ schools drug free. Only half of parents whose teens attend schools where drugs are used, kept or sold would transfer their teen to a drug-free school if they could. Among these parents who would not change schools, half believe there is no such thing as a drug-free school.

The Perils of Pot

This year’s survey is the first time that a higher percentage of teens finds marijuana easier to buy than cigarettes and beer. Such teens have a risk of substance abuse one and a half times greater than average.

Teens who perceive marijuana as “not harmful” are at more than two and a half times greater substance-abuse risk than teens who think marijuana is “very harmful.”

The Early Teens: The Dangerous Years

Most teens who use alcohol, cigarettes and marijuana do so by the time they are 15. Among teens who admit to smoking, drinking or having tried marijuana, by age 15: 95 percent have had their first cigarette; 93 percent their first drink and 86 percent their first joint.
Between ages 12 and 16:

- The likelihood that a teen will smoke, drink or use illegal drugs increases almost 500 percent.

- The percentage of teens who would not report a drug user at school increases almost 500 percent. The percentage of teens who would not report a drug seller at school increases more than 500 percent.

- The percentage of teens who have close friends that use marijuana increases 1,000 percent.
Chapter II
How CASA Calculates Teen Substance-Abuse Risk

For seven years, CASA has been conducting a major survey of public opinion on substance abuse, seeking answers to the question: “Why do some teenagers succumb to the use of illegal substances while others do not?”

This survey continues an analysis aimed at revealing the factors that contribute to teen substance-abuse risk. We have found that the risk of substance abuse can be attributed to identifiable characteristics of teenagers, their household, their parents and their school environment. By identifying factors that contribute to a teenager’s risk of substance abuse, we discover targets for prevention and intervention.

This year’s survey, like previous CASA surveys, is not intended to be an epidemiological study of substance abuse. While CASA’s survey includes questions about substance use, for measurements of the actual incidence of drug and other substance usage there are other sources of data. This survey was conducted by telephone with a randomly selected sample of teenagers (ages 12 to 17) living in the United States. Despite assurances of confidentiality, we assume that some teenage respondents will be reticent to admit illegal activities over the telephone to someone unknown to them. Therefore, this survey--like any telephone survey--most likely underreports the extent of use of illegal drugs or the consumption of tobacco products and alcohol by underage teenagers, and over-reports positive behaviors.

Consequently, the CASA strategy for assessing the substance-abuse risk of a teenage respondent is to measure the prevalence of tobacco, alcohol and illegal drugs in the teen’s daily life. We use a statistical procedure called factor analysis to combine a teen’s response to eight survey questions (Table 2.A) to yield a “substance-abuse risk score” for each teen respondent. Factor analysis also confirms the validity of
combining the eight indicator variables into a single scale. This risk score becomes our key dependent variable, the phenomenon we seek to explain by reference to the other responses and characteristics of the teen and his or her parent.

To put this risk score in context, the average risk score for all teens is 1.0, the risk score for a teen who does not smoke, drink or use illegal drugs is 0.40, and the risk for a teen who admits to currently smoking or drinking or having tried marijuana is 2.2.

It is important to appreciate that this risk variable represents our inference of respondent risk, since risk cannot be measured directly via a survey. Still, there is a high degree of internal consistency in the pattern of responses to the eight indicator variables, including a high correlation between the variables that measure proximity to tobacco, alcohol and drugs, and those that directly measure respondents’ substance use. This gives us confidence that the risk score is accurately reflective of the

Table 2.A
The Eight CASA Indicators of Teenage Substance Abuse Risk

1. How often have you smoked cigarettes during the past 30 days? (Questions 31/32)
2. How many of your friends drink alcoholic beverages? (Question 33)
3. How often do you get drunk? (Questions 36/38)
4. How many of your friends use marijuana? (Question 53)
5. Do you know a friend or classmate who uses acid, cocaine or heroin? (Question 51)
6. How long would it take you to buy marijuana? (Question 54)
7. Have you ever tried marijuana? (Question 69)
8. How likely is it that you will try illegal drugs in the future? (Question 71)

Table 2.B
What the Risk Categories Mean

High Risk Teens (21 percent of 12- to 17-year olds)
- Many smoke (53 percent currently smoke, 41 percent smoke daily)
- Most have tried alcohol (and 38 percent currently drink alcohol in a typical week)
- Most get drunk (67 percent at least once a month)
- Most have friends who use marijuana (84 percent)
- Most know a friend or classmate using Ecstasy (75 percent)
- Most know a friend or classmate using acid, cocaine or heroin (76 percent)
- Most could buy marijuana in less than one hour (64 percent)
- A vast majority have tried marijuana (89 percent)
- More than half say future drug use “likely” (52 percent)

Moderate Risk Teens (39 percent of 12- to 17-year olds)
- Very few smoke (98 percent did not have a cigarette in past 30 days)
- Almost half have tried alcohol (49 percent)
- Fewer get drunk in a typical month (eight percent)
- Many have marijuana-using friend (49 percent)
- More than one-third know a friend or classmate who uses Ecstasy (42 percent)
- More than half know friend or classmate who uses acid, cocaine or heroin (56 percent)
- Many could buy marijuana in a few hours or less (44 percent)
- Fewer have tried marijuana (17 percent)
- Half admit any possibility of future illegal drug use (53 percent)

Low Risk Teens (40 percent of 12- to 17-year olds)
- None smoke (100 percent did not have a cigarette in past 30 days)
- Fewer have tried alcohol (13 percent, and virtually none drink alcohol)
- Virtually none get drunk in a typical month (99 percent never get drunk)
- Very few have friends who smoke marijuana (one percent)
- Very few know a friend or classmate who uses Ecstasy (four percent)
- Fewer know user of acid, cocaine or heroin (nine percent)
- More than half would be unable to buy marijuana (61 percent)
- None have tried marijuana
likelihood of a teen abusing tobacco, alcohol or illegal drugs.

CASA collapsed the individual risk scores into three score ranges and found that the 1,000 teens surveyed fell into these categories of risk: 40 percent of the nation’s 12- to 17-year olds are at a relatively low risk of substance abuse, 39 percent are at moderate risk and 21 percent are at high risk. (Figure 2.1) The practical meaning of these risk categories appears in Table 2.B.

The Early Teens: The Dangerous Years

Among teens who admit to smoking, drinking or having tried marijuana, by age 15: 95 percent have smoked their first cigarette, 93 percent have tried their first drink and 86 percent have smoked their first joint. The average age of first use for such teens is 12 ¼ for cigarettes, 12 ½ for alcohol and 13 ½ for marijuana.

Between ages 12 and 16:

- The likelihood that a teen will smoke, drink or use illegal drugs increases almost 500 percent (from 0.32 at age 12 to 1.50 at age 16, Figure 2.2).

- The percentage of teens who have close friends that use marijuana increases 1,000 percent (from six percent to 61 percent).

- The percentage of teens who would not report a drug user at school increases almost 500 percent (from 13 percent to 63 percent, Figure 2.3). The percentage of teens who would not report a drug seller at school increases more than 500 percent (from 11 percent to 58 percent, Figure 2.3).

The 12- to 16-year old age range usually coincides with the transition from middle to high school.
Chapter III
Siblings: Protectors or Pushers

Siblings have a significant impact on a teenager’s propensity to use tobacco, alcohol or illegal drugs—for good or ill. An older sibling can be a protector whose conduct provides a support system that helps a younger sibling stay substance free. Or a sibling can be a pusher in the home by the example of their own drug use or by offering or encouraging a younger sibling to use drugs. In this survey, 55 percent of teens have one or more older siblings.

Two-thirds (67 percent) of teens with an older sibling say their older brothers or sisters would be “very angry” to find out they were using marijuana. These teens are at substantially lower risk of substance abuse than teens who think their older siblings would not be very angry (0.73 vs. 1.65, Figure 3.1).

If a teenager’s older sibling is expected to be less than “very angry” in reacting to a younger sibling’s drug use, the younger sibling has an above-average risk of substance abuse.

Whether or not a teen thinks his or her older sibling is using drugs has a similar impact on substance-abuse risk. Almost half (48 percent) of teens with an older sibling think that an older brother or sister has tried illegal drugs. These
teens are at one and a half times greater risk of substance abuse than the average teen.

Most disturbing is that 12 percent of teens with an older sibling report that an older brother or sister has encouraged them to use or offered them illegal drugs. Living with such a pusher in the home puts the younger sibling at highest risk: twice as likely to smoke, drink or use illegal drugs as the average teen.
Chapter IV
Drugs in Schools

After a teenager’s family environment, a teen’s school may represent the next greatest situational influence on his or her likelihood of using tobacco, alcohol or illegal drugs. Teens spend half or more of their waking hours at school during the school year. Whether they spend that time in a drug-free environment or a place where drugs are used, kept or sold has a substantial impact on their substance-abuse risk.

This year, for the first time in the history of CASA’s survey, the majority of teens (63 percent) report that they attend drug-free schools. This represents a significant increase over the 45 percent that reported this in 2000. (Figure 4.1) This improvement occurred at every grade level.

Religious schools are more likely to be drug free than public schools, but both showed dramatic increases this year. Seventy-nine percent of religious schools are reported to be drug free vs. 65 percent in 2000. Sixty-two percent of public schools are reported to be drug free this year, up from 42 percent in 2000. (Figure 4.2)

Whether or not a school is drug free has a dramatic influence on the substance-abuse risk of the student body. The average risk score of teens attending school at which drugs are used,
kept or sold is 1.47—nearly twice the average risk score of teens attending drug-free schools (0.76).

To put this another way, teens at schools where drugs are used, kept or sold are:

- Two and a half times likelier to get drunk on a monthly basis than those in a drug-free school.
- Two times likelier to have been offered marijuana.
- Two times likelier to have tried marijuana.
- More than twice as likely to know a teenager who uses acid, cocaine or heroin.
- Three times likelier to smoke.

Where There’s Smoke, There’s Fire

Smoking on school grounds and drugs in schools appear to go hand-in-hand: drugs are used, kept or sold at more than half (55 percent) of schools where students smoke on school grounds, but at less than a quarter (21 percent) of schools where students do not smoke on school grounds.

Drug-Free Schools and Student Behavior

Drug-free school environments appear to beget attitudes among the student body which help perpetuate the drug-free environment—and keep teens safer when they are not in school. Teens who attend drug-free schools are more than twice as likely to report a student using illegal drugs at school than teens at schools where drugs are used, kept or sold (67 percent vs. 30 percent), and almost twice as likely to report a student selling drugs at school (66 percent vs. 36 percent).

Teens who would report a drug user at school are at a third the risk of substance abuse of teens who would not (0.53 vs. 1.57) and teens who would report a drug seller at school are at a third the risk of substance abuse of those who would not (0.55 vs. 1.65).
Parents of teenagers cite drugs and alcohol as the biggest concern they have about their teenagers. Fifty-nine percent of parents are concerned that their teen will try illegal drugs at some point in the future. Yet a disturbing number of parents seem to think and act as if they have no control over their teens’ decisions to use these substances.

Though CASA has repeatedly found parents to have the most important influence in preventing substance abuse among their children, 35 percent of parents think that parents have little influence over their teens’ decisions about whether to use tobacco, alcohol or illegal drugs, up from 25 percent in 1999.

Forty-three percent of parents--but just 16 percent of teens--think future illegal drug use by their teen is “likely.” Teens whose parents think future drug use is “very likely” are three times likelier to smoke, drink or use illegal drugs.

Next to parents, schools may have the most influence on a teen’s substance-abuse risk. Yet when it comes to drugs in schools, parents seem to be paralyzed. While 43 percent of parents recognize that their teen’s school is not drug free, only half of those would transfer their teen to a drug-free school if they could. Among these parents who would not change schools, half believe there is no such thing as a drug-free school.

Among parents who report that their teen attends a school at which illegal drugs are used, kept or sold, there is little evidence of an inclination to hold school administrators accountable: 89 percent tell us there are drugs in their teen’s school “despite the best efforts of administrators.” Nor are these parents, by and large, demanding to be heard on the subject of creating a drug-free school environment:
58 percent say they have “never had the opportunity of expressing their opinion about drugs at [their] teen’s school.”
Chapter VI
The Role of Grandparents

This year we examined the impact grandparents have on teen risk. Grandparents are a major presence in the lives of teenagers:

- Eighty-four percent report they usually receive a present from their grandparents on their birthday or at Christmas or a similar holiday.

- Fifty-five percent say a grandparent is “always” on hand when the family celebrates a holiday or occasion.

- Forty-two percent see a grandparent at least weekly; the median response is once every two weeks.

- Forty percent talk with a grandparent on the phone at least weekly; the median response is once every two weeks.

- Twenty-seven percent spend time with a grandparent without a parent around at least weekly; the median response is once a month.

Yet teens with the greatest frequency of contact with their grandparents are at no lower risk of substance abuse than other teens. The only aspect of the grandparent/grandchild relationship which we found does have an impact on teen substance-abuse risk is the quality of the relationship.

In 2000, we reported that teens who describe their relationship with their parent or parents as “excellent” have a lower average risk score. A similar phenomenon takes place with grandparents: teens who report they like being with the grandparent they see most often “a whole lot,” (49 percent of teens with at least one living grandparent) or “pretty much,”
(34 percent) have significantly lower risk scores than teens who enjoy being with their grandparents “not much” or “not at all.” (Figure 6.1)
Chapter VII
Other Notable Findings

Perceptions of Risk

When asked which of the following was most dangerous: alcohol, cocaine, Ecstasy, marijuana or tobacco, parents and teens overwhelmingly agreed that cocaine and Ecstasy were the most harmful.

Among teens who see marijuana as “very harmful” (66 percent), 15 percent admit to having tried it, while among those who regard marijuana as “not too harmful” or “not harmful” (13 percent), 55 percent--more than three times as many--admit to having tried it.

Availability

Marijuana may be getting easier to obtain: this year 34 percent of teens surveyed say marijuana is easier to buy than both beer and cigarettes. In the 2000 survey, marijuana was tied with cigarettes for ease of purchase. Teens for whom marijuana is the easiest of these three substances to obtain are one and a half times likelier than the average teen to use drugs.

Indicators of Risk

Academic Performance

For the most part, grades and substance-abuse risk have a strong inverse relationship: the higher the grades, the lower the risk score. Teens who usually get A’s and B’s in school are at half the risk of teens getting C’s, D’s or F’s in school. (Figure 7.1)

Truancy

Teens with six or more unexcused absences in the last year are at nearly three times the substance-abuse risk of teens with no such absences (64 percent of teens report they had no unexcused absences last school year).
**Detentions**

Teens with just six or more detentions in the last year are at two and a half times the risk of teens with no detentions (55 percent reported no detentions last school year).

**Religious Involvement**

As in CASA’s previous surveys, religious involvement—measured by the number of times in a typical month the teen attends religious services—reduces substance-abuse risk. Teens who attend religious services four or more times per month are at nearly half the risk of teens who do not attend religious services. (Figure 7.2)
Appendix A
Sample Performance

A good way to assess the quality of the achieved survey sample is to compare the results obtained in the survey with known characteristics of the target population, in this case the national population of teenagers between 12- and 17-years of age. Five demographic characteristics are of particular interest to us: age, sex, race, ethnicity and family structure. Our benchmark is the January 2002 Current Population Survey (CPS) conducted by the U.S. Census Bureau, which is itself a survey—not a census—but for our purposes is considered definitive. Table A.1 compares the achieved results of our survey with the results of the CPS. The reported survey results throughout this report are weighted, meaning mathematically adjusted to correct for an over-representation of 15- and 16-year olds. Since Table A.1 reports both our initial unweighted and final weighted results, a reader can assess the impact of this corrective.

Finally, respondents were asked at the conclusion of the interview if their answers could be overheard by someone at their home. Twenty-seven percent said they could be overheard. Teens who believed that someone could overhear the interview had only a slightly lower risk score (0.99 vs. 1.01) suggesting little impact in terms of respondents being cautious about giving responses that indicate substance-abuse risk.

Appendix B
Survey Methodology

The questionnaire for this survey was designed by the staffs of QEV Analytics and CASA. Questions and themes were pre-tested by conducting focus groups in Paterson, New Jersey, with teens and parents of teenagers. This year’s focus groups were conducted among a predominately Hispanic community; qualitative research in previous years has focused on other ethnic and racial communities.

This survey was conducted by telephone, utilizing a random-digit-dial technique (RDD), in which a pool of telephone numbers was created representing all 48 continental states in proportion to their population, using extensive information concerning telephone number assignments across the country. The random generation of telephone numbers has the advantage of capturing unlisted numbers. This pool of randomly generated telephone numbers was prepared by Survey Sampling, Inc. of Connecticut.

The random-digit telephone numbers were called, and the household was qualified for participation in the survey by determining that a teen 12- to 17-years old lived in the household (see Appendix C for screening questions). At least four call back attempts were made to each telephone number before the telephone number was rejected.

Once a household was qualified as the residence of an eligible teenager, 12 to 17, permission for survey participation was sought from the teen’s parent or guardian. If the potential teen participant was available at the time of the initial contact with the parent or the guardian, the teen interview was attempted and the interview with the parent or the guardian was sought in a subsequent call. If the potential teen participant was not available at the time of the initial contact with the parent or guardian, then the parent/guardian interview was attempted, and a call back scheduled for the teen interview.
In total, 1,000 teenagers and 541 parents of teenagers were interviewed between December 27, 2001 and February 6, 2002. The margin of sampling error for the teen survey is ±3.1 percent at a 95 percent confidence level (meaning, were it possible to interview all teenagers in the country between the ages of 12 and 17, the results would vary by no more than ±3.1 percent, 19 times out of 20, from what was found in this survey).

Of the 541 parent/guardian interviews, 317 were conducted with households in which a teen was also interviewed (two-interview households), and the responses of the parent and teen were linked so as to allow direct comparison of parent and teen responses from the same household. The margin of sampling error for the parent/guardian sample of 541 is ±4.2 percent (at the 95 percent confidence level). While we consider the random selection of households with teenagers in residence to yield a representative sample of parents of teenagers as well, it should be noted that parents were interviewed only after consenting to the participation of their teenager in the survey; this protocol could potentially influence the representativeness of the parents’ sample.

The data collection process was supervised by QEV Analytics of Washington, D.C. After comparing the results of the survey with known national population characteristics, weighting was applied to bring the achieved age and gender distribution into line with the January 2002 Current Population Survey of the U.S. Census Bureau. The survey analysis was done by Steven Wagner and Elehie Skoczylas; the writing of the report was done by Wagner and Skoczylas and CASA staff.

Table B.1 summarizes the number of calls necessary to achieve the completed sample of 1,000 interviews and presents the results of all calls to the RDD sample generated by Survey Sampling, Inc.

</table>

* In this survey, we are seeking respondents representing a small subpopulation of all residents of the United States (roughly 10 percent). We are not able to distinguish here between refusals to participate by a telephone gatekeeper (typically a parent) and the eligible teen himself or herself. But we would expect that 27,266 of 30,286 households dialed at random would not have a resident teenager 12- to 17-years of age. Therefore, we expect that perhaps 5,636 or so of the refusals were in fact ineligible households not willing to respond to the screening questions.
Appendix C
Screening Questions

VERBAL PROTOCOL FOR THE TEEN QUESTIONNAIRE:
PARENTAL CONSENT

Introduction: "Hello, my name is (__________) and I'm calling from QEV Analytics, a public opinion research firm. We are conducting a very important nationwide survey on the risks facing teens for a research center at a major university. We are looking for teenagers between 12- and 17-years old to participate in this survey. Is there someone between 12 and 17 living at your home?"

[IF YES]

Is the ADULT parent or guardian of this teen available?

[IF YES]

May I speak with him/her please?

[IF NOT HOME OR AVAILABLE, ASK FOR TIME FOR CALL BACK]

[IF NO] Thank and terminate.

[IF THE PERSON ON THE PHONE WAS NOT THE ADULT, AND THE ADULT THEN COMES TO THE PHONE, REPEAT INTRODUCTION DISPLAYED IN PARENTHESES, ELSE CONTINUE AT THE ‘*’]

(Introduction: "Hello, my name is (__________) and I'm calling from QEV Analytics, a public opinion research firm. We are conducting a very important nationwide survey on the risks facing teens for a research center at a major university). *This is not a sales call; I am not going to ask the teen to buy or do anything. No monetary or other incentive will be offered to your teen. All responses are completely anonymous and strictly confidential. No one will ever be able to link the responses given on the phone survey back to you or your teen. You or the teen may stop the interview at any time for any reason. The phone interview should take no longer than 30 minutes.

We will ask questions about the teen’s living situation, their relationship with a grandparent, their activities at school, their attitudes about tobacco use, alcohol use and other drug use, and their experiences with tobacco, alcohol and marijuana.

Will you give us permission to talk over the phone with the teen in your house about these issues?”

[IF YES]

“Would YOU also be willing to speak to us about these and other issues? Could I have the first initial of your first name please?”

[NOTE ANSWER FOR CALL BACK TIME OR NO CALL BACK]
If at any time you have a question about or problem with this survey, you can call this number: 1-877-XXX-XXXX. Please refer to Protocol #130, and ask for Dr. Foster. [This message is repeated whenever a question is raised during the survey]

Thank you for your help. May I speak with the teen please?

[IF NO TO PERMISSION] Thank and terminate.

* * *

VERBAL PROTOCOL FOR THE TEEN QUESTIONNAIRE:

TEEN ASSENT

Introduction: "Hello, my name is (__________) and I'm calling from QEV Analytics, a public opinion research firm. We are conducting a very important nationwide survey on the risks facing teens for a research center at a major university. We are looking for teenagers between 12- and 17-years old to participate in this survey. Is there someone between 12 and 17 living at your home?"

[IF YES]

Is the ADULT parent or guardian of this teen available?

[IF YES]

May I speak with him/her please?

[IF NOT HOME OR AVAILABLE, ASK FOR TIME FOR CALL BACK]

[IF NO] Thank and terminate.

[ONCE ADULT CONSENT IS OBTAINED]

Hello, my name is (__________) and I'm interviewing teenagers across the country about what it's like to be a teenager in America today. This is not a sales call; I am not going to ask you to buy or do anything. No monetary or other incentive will be offered to you. I just want to learn about some of your experiences and opinions on issues of importance to teenagers. Your answers are completely confidential. I don’t have your name, and no one will ever know how you responded. This interview will take about 30 minutes, and there are no right or wrong answers to these questions. You may stop the interview at any time for any reason.

We will ask questions about your living situation, your relationship with a grandparent, your activities at school, your attitudes about tobacco use, alcohol use and other drug use, and your experiences with tobacco, alcohol and marijuana.

[IF THIS TEEN’S PARENT IS TO BE CALLED BACK]

We have also asked to speak with your parent/guardian, and will ask him/her about similar issues. A different interviewer will call back to speak with him/her. I will not speak with him/her, and he/she will never know how you answered these questions.

Are you willing to complete the survey?
[IF NO] Thank and terminate.

[IF YES]

If at any time you have a question about or problem with this survey, you can call this number: 1-877-XXX-XXXX. Please refer to Protocol #130, and ask for Dr. Foster. *[This message is repeated whenever a question is raised during the survey]*

* * *

**VERBAL PROTOCOL FOR THE PARENT QUESTIONNAIRE:**

**PARENTAL CONSENT**

Introduction: “Hello, my name is (______________________) and I'm calling from QEV Analytics, a public opinion research firm. We are conducting a very important nationwide survey on the risks facing teens for a research center at a major university. We are looking for parents of teenagers between 12- and 17-years old to participate in this survey. Is the parent with first initial “__” of the teenager available to speak with me?”

[IF YES, CONTINUE WITH SURVEY]

[IF NOT AVAILABLE]

When would be a good time to call back? *[RECORD CALL BACK TIME]*

[IF NO] Thank and terminate.

[PARENTS’ INTRODUCTION]

[REPEAT AS NECESSARY] Hello, my name is (______________________) and I'm calling from QEV Analytics, a public opinion research firm. We are talking today with parents of teenagers about the risks facing teens for a research center at a major university.

In an earlier call you had indicated that you would be willing to answer some questions in a phone interview. Recall that this is not a sales call; I won’t ask you to buy or do anything. This interview will take about 30 minutes, and your answers are completely confidential. There are no right or wrong answers to these questions, we really just want to learn about your opinions and experiences. You may stop the interview at any time for any reason. Do I have your permission to begin?”

[IF YES, BEGIN]

I want to remind you that at any time you have a question about or problem with this survey, you may call 1-877-XXX-XXXX. Please refer to Protocol #130, and ask for Dr. Foster.

[IF NO, ASK FOR CALL BACK TIME]

[If asked, we will tell parents that the responses of both the teen and the parent are completely confidential and neither party shall have access to the other's answers. In addition, the person doing the questioning will not be the same for parent and teen and therefore will not have knowledge of or access to any of the other party's responses]
